

[YOUR LOGO]

Vibe Editing

One raw recording in. A week of finished, captioned, self-audited vertical clips out. One command, one operator.

This is the exact system our media team runs — packaged so you can run it yourself. Drop in your footage, plug in your style, and ship.

What this is

Vibe Editing is a single command that turns one long recording — a Q&A, a podcast, an interview, a talk — into a batch of finished, ready-to-post vertical clips. It transcribes, finds the best moments, cuts them, reframes to 9:16 with face-tracking, burns on captions, mixes music, and then **audits its own work** with six independent reviewers before anything is called done.

It isn't an app you log into. It's an orchestrated set of skills running inside Claude Code on your machine, wired to a handful of best-in-class tools. The result: **one person produces at the volume of a full editing team**, and quality is enforced by gates, not by hoping.

The flywheel it powers

Create feeds distribution, distribution feeds data, data feeds the next batch — and each turn compounds.

Every tool inside it

Nothing here is exotic. The engine is the *orchestration* — it drives these tools in the right order and checks the output. You supply your own accounts/keys where noted.

TOOL	JOB IN THE PIPELINE	COST
Claude Code	The brain. Runs the skills, makes the editorial calls, orchestrates every step.	your plan
Groq (Whisper)	Fast word-level transcription — the timeline everything else is cut from.	free tier
ffmpeg + libass	The workhorse: cutting, encoding, and burning captions into the video.	free
OpenCV + YuNet	Face detection & tracking for the 16:9 → 9:16 reframe.	free
ElevenLabs	Audio cleanup, voice isolation, and sound-effects generation.	your key
Remotion (React)	Branded motion graphics — intros, end-cards, the flywheel-style explainer videos.	free Node
yt-dlp / rclone	Ingest footage from a URL or a cloud drive, straight into a project folder.	free
Whisper (local)	Offline transcription fallback when you'd rather not use an API key.	free

Free vs. paid, honestly: the core path (ingest → transcribe → cut → reframe → caption → render → audit) runs on free, open tools. The only things you pay for are your own Claude Code plan and — if you use them — ElevenLabs for audio polish and Groq above its free tier.

How a clip gets made, step by step

You run one command and the engine walks this spine. The **YOU SET THIS** tags mark where your taste plugs in (covered on the next page).

```
$ claude "cut this Q&A into 6 vertical clips"
```

- 1 **Ingest & scaffold.** Pull the footage from a file, URL, or drive link into a clean project folder (source / work / deliver).
- 2 **Understand the footage.** Detect faces, camera angles, and audio levels so later steps frame and cut correctly.
- 3 **Transcribe.** Word-level timestamps — the spine every cut is anchored to.
- 4 **Mine the best moments.** Score candidate clips against proven engagement patterns and rank them. **YOUR STYLE**
- 5 **Pick the exact in/out.** Lock each clip to a clean hook → context → payoff. No chopped words, no false endings.
- 6 **Cut & clean.** Remove filler, dead air, and stumbles; splice on silences so it sounds seamless.
- 7 **Reframe to vertical.** Face-tracked 16:9 → 9:16 so the speaker stays centered. **YOUR LOOK**
- 8 **Caption.** Burn on word-by-word captions in your style — color, emphasis, position. **YOUR STYLE**
- 9 **Score & mix music.** Match a track to the clip's energy and duck it under the voice. **YOUR MUSIC**
- 10 **Render.** Build it in cached stages so later revisions only rebuild what changed.
- 11 **Audit — 6 gates.** Six independent reviewers must all pass (next section). Nothing that fails ships.
- 12 **Deliver.** Finished clips land in the deliver folder for your final eye.

Revisions are surgical. Change a caption typo and only the caption step re-runs — not the whole clip. The engine caches every stage and rebuilds from the change forward.

The six self-audit gates

This is what makes it trustworthy enough to run hands-off. After every render, six reviewers each check *one* thing — in a fresh context, with no knowledge of how the clip was made — and **all six must pass** or the clip is blocked.

Gate 1

Mechanics

Resolution, duration, black/frozen frames, clean ends.

Gate 2

Narrative

Hook, one clear arc, the payoff lands as the last line.

Gate 3

Visual

Face tracking, framing, no jump cuts or artifacts.

Gate 4

Audio

No clipped words, pops, or level jumps; music balanced.

Gate 5

Captions

Accuracy, timing, color, emphasis, positioning.

Gate 6

Script

Does a cold viewer get it? Context before payoff.

It compounds. When you give feedback, it doesn't just fix the clip — it becomes a permanent gate. The same mistake never ships twice. That's why the system gets better every cycle instead of drifting.

Your turn — what you plug in

The engine is brand-neutral on purpose. These are the five places *you* define your style. Fill these in and the clips come out sounding and looking like you, not like a template.

① YOUR FOOTAGE

Drop your raw recordings into the project's source folder (or paste a URL / drive link). Originals are never edited — the engine always copies first.

② YOUR CLIP TASTE

What makes a moment worth clipping for *your* audience? Your hooks, your topics, the kind of payoff you end on. This is your editorial voice — write it once and the miner uses it.

③ YOUR CAPTION LOOK

Pick your font, your colors, your emphasis style, and where captions sit on the frame. A clean free font ships as the default — swap in yours.

④ YOUR MUSIC

Point the engine at your own royalty-free music folder. It matches a track to each clip's energy automatically — but the library is yours to supply.

⑤ YOUR KEYS

Paste your own API keys (Claude, and optionally Groq / ElevenLabs) into the config file. The engine loads them automatically from then on.

Everything above lives in plain text/config files with comments showing exactly where to type. No code changes required to make it yours.

Install & run

Prerequisites

Claude Code · Python 3.10+ · ffmpeg (with libass) · and, by path, yt-dlp / rclone for ingest and Node for the graphics end-cards.

1 · Install the kit

```
/plugin marketplace add ./vibe-editing-starter /plugin install vibe-editing
```

2 · Add your keys

```
config/keys.env CLAUDE_API_KEY=your_key  
GROQ_API_KEY=your_key
```

3 · Point it at your assets

Drop a font in the fonts folder, a few tracks in the music folder, and your footage in source. Defaults work out of the box.

4 · Run it

```
$ claude "cut this into 6 vertical clips"
```

Finished clips appear in the project's deliver folder, already audited.

What's included vs. what you bring

Included: all the skills, the render engine, the 6 audit gates, the music-matching logic, a free default font.

You bring: your API keys, your footage, your music tracks, and (optionally) your own font & brand.

First run: test on one short clip end-to-end to confirm ffmpeg, your keys, and your assets are wired up. After that, batches just work.

White-label edition. Replace the cover logo and pick your own product name. This kit ships brand-neutral with no third-party licensed fonts or proprietary data — those are yours to add.
